ABSTRACT

The **Word-Level Plagiarism Checker for Short Documents** is designed to identify copied and lightly paraphrased text in essays, assignments, abstracts, reports, and other short documents. The system compares an input document with a reference corpus at the word level to detect exact matches, reordered phrases, and minor word substitutions. Unlike basic plagiarism checkers that rely only on sentence-level similarity, this approach analyzes word sequences and contextual relationships to improve detection accuracy. It also identifies the original source of each matching text segment and generates a detailed plagiarism report with similarity scores and highlighted copied passages. The system is optimized for interactive use by employing efficient indexing and search techniques while avoiding dependence on prebuilt library data structures. This project provides educators, editors, and publishers with a fast, reliable, and transparent plagiarism detection solution that supports academic integrity, improves content originality, and assists in identifying potential copyright violations with high precision and efficiency.
